CS 331 Midterm Exam Worksheet

| |
|---------------|
| WP1 (/8) : |
| WP2 (/8) : |
| WP3 (/8) : |
| TOTAL (/24) : |

Python data structures

WP1

```
def zip(*seqs):
    its = [iter(l) for l in seqs]
    z1 = []
    while True:
        try:
            z1.append(tuple(next(it) for it in its))
        except:
            return z1
```

OR

```
def zip(*seqs):
    min_length = len(seqs[0])
    for i in range(1, len(seqs)):
        if len(seqs[i]) < min_length:
            min_length = len(seqs[i])
    ziplist = []
    for i in range(min_length):
        ziplist.append(tuple(l[i] for l in seqs))
    return ziplist
```

Mystery sort

WP2(a)

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| 3 | 2 | 4 | 6 | 0 | 7 | 5 | 1 |
| 0 | 2 | 4 | 6 | 3 | 7 | 5 | 1 |
| 0 | 1 | 4 | 6 | 3 | 7 | 5 | 2 |
| 0 | 1 | 2 | 6 | 3 | 7 | 5 | 4 |
| 0 | 1 | 2 | 3 | 6 | 7 | 5 | 4 |
| 0 | 1 | 2 | 3 | 4 | 7 | 5 | 6 |
| 0 | 1 | 2 | 3 | 4 | 5 | 7 | 6 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |

WP2(b)

$O(N^2)$

WP2(c)

Prefer insertion sort, as it does better than this mystery sort function on partially ordered lists.

Array-backed list

WP3

```
class ArrayList:
    def __init__(self):
        self.data = []

    def move(self, idx_src, idx_dst):
        x = self.data[idx_src]
        if idx_dst < idx_src:
            for i in range(idx_src, idx_dst, -1):
                self.data[i] = self.data[i-1]
        else:
            for i in range(idx_src, idx_dst):
                self.data[i] = self.data[i+1]
        self.data[idx_dst] = x
```
